

Intermolecular Forces

I. A note about gases, liquids and solids.

- A. Gases:
  - B. Liquid:
  - C. Solid:
- II. A substance's state at a certain temperature depends on

- A. Gases: kinetic energy of the particles is high, the attractive forces between the particles are weak.
- B. Liquid: kinetic energy of the particles is moderate, but not high enough to overcome the attractive forces.
- C. Solid: kinetic energy of the particles is low, so the attractive forces are dominant.

III. Intermolecular forces are

- A. Less energy is needed to overcome them than to break covalent bonds.
- B. These forces influence the physical properties of a substance.
- C. Introducing: London dispersion forces.
- D. These forces are present in all molecules.

important. (Remember that London dispersion forces are the only intermolecular forces present in non-polar molecules.)

these forces become more

- a. Occurs in all molecules, but is the only one present in non-polar molecules.
- b. Molecules that have a permanent dipole moment.
  - i. The electrostatic forces b/w the partial positive and partial negative charges.
  - ii. a.k.a. Dipole-dipole interactions.
- c. What is actually happening:
  - i. Temporary dipoles are induced in the molecules as they come into close contact with each other.
  - ii. a molecule's electron cloud is distorted by the electric field of the other molecule.

d. Strength of dispersion force is Why?

- i. the bigger something is,
- ii. the more

**TABLE 11.3 Boiling Points of the Halogens and the Noble Gases**

Halogen	Molecular Weight (amu)	Boiling Point (K)	Noble Gas	Molecular Weight (amu)	Boiling Point (K)
F <sub>2</sub>	38.0	85.1	He	4.0	4.6
Cl <sub>2</sub>	71.0	238.6	Ne	20.2	27.3
Br <sub>2</sub>	159.8	332.0	Ar	39.9	87.5
I <sub>2</sub>	253.8	457.6	Kr	83.8	120.9
			Xe	131.3	166.1

e.

*n*-Pentane  
(bp = 309.4 K)

Neopentane  
(bp = 282.7 K)

2.

- a. Occurs in
- b. Larger the dipole moment (

),

c. These are

3.

- a. Occurs in polar molecules that have an
- b. Stronger than
- c. They are so strong because of the attraction b/w the

E. Relative strength:

1.

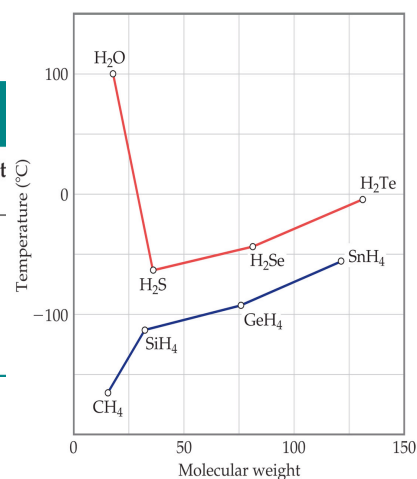

2. If the is the same,

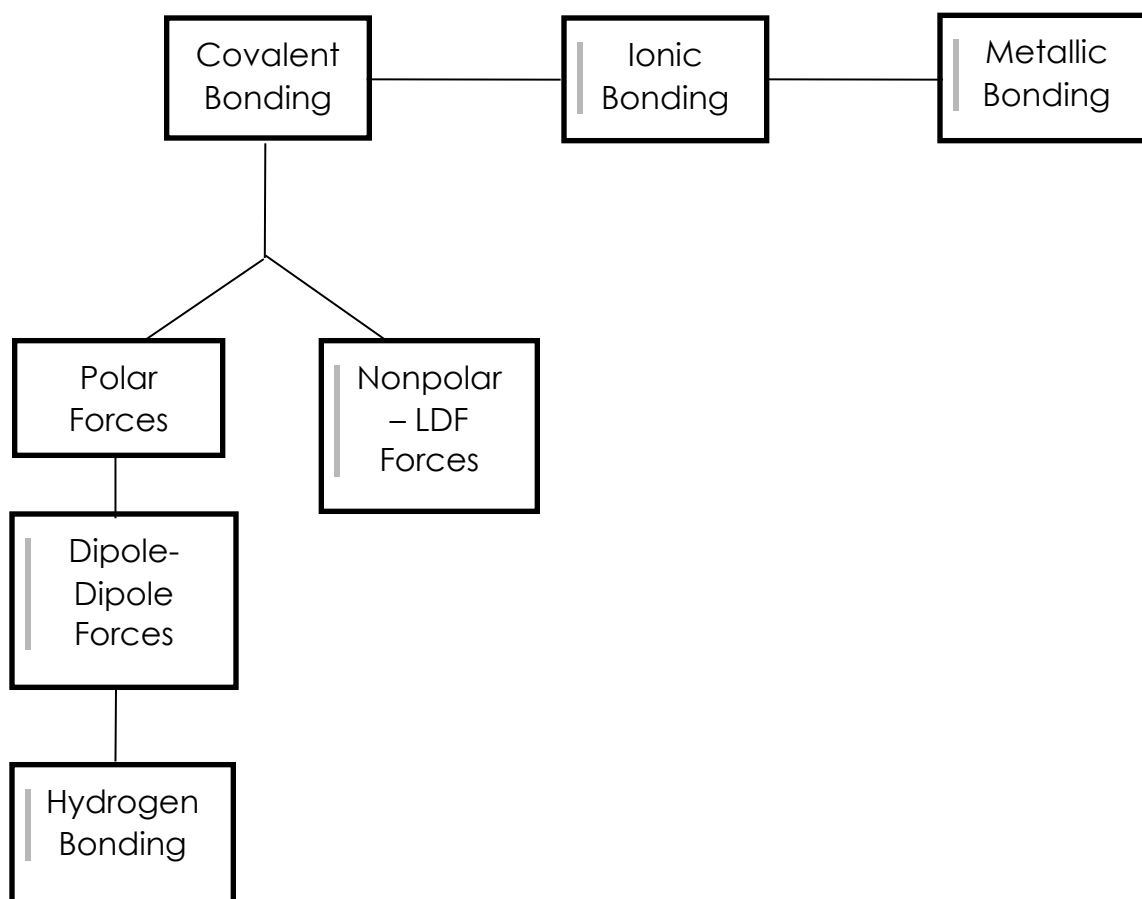

3. If is the same,

**TABLE 11.2 Molecular Weights, Dipole Moments, and Boiling Points of Several Simple Organic Substances**

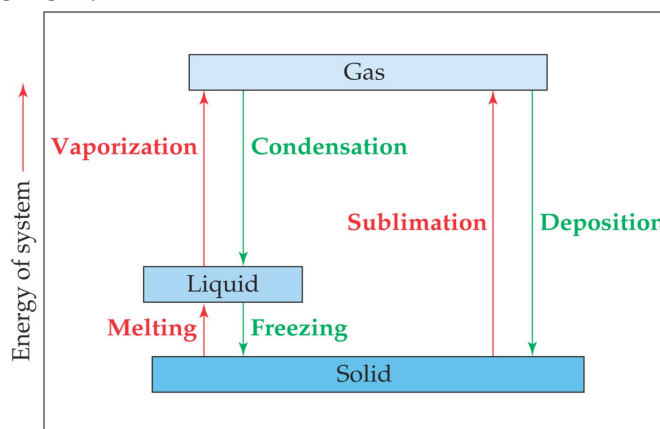

Substance	Molecular Weight (amu)	Dipole Moment $\mu$ (D)	Boiling Point (K)
Propane, CH <sub>3</sub> CH <sub>2</sub> CH <sub>3</sub>	44	0.1	231
Dimethyl ether, CH <sub>3</sub> OCH <sub>3</sub>	46	1.3	248
Methyl chloride, CH <sub>3</sub> Cl	50	1.9	249
Acetaldehyde, CH <sub>3</sub> CHO	44	2.7	294
Acetonitrile, CH <sub>3</sub> CN	41	3.9	355

Phase Changes

I. Phase change review:

II.

during phase changes.

III. Energy changes:

A. Heat of vaporization ( )::

B. Heat of fusion ( )::

IV. Heating (Cooling) Curves (q or E v. T):

A.

## Ch. 9 Liquids and Solids

Calculate the enthalpy change upon converting 1.00 mol of ice at  $-25^{\circ}\text{C}$  to water vapor (steam) at  $125^{\circ}\text{C}$  under a constant pressure of 1 atm. The specific heats of ice, water, and steam are  $2.09 \text{ J/g}\cdot\text{K}$ ,  $4.18 \text{ J/g}\cdot\text{K}$  and  $1.84 \text{ J/g}\cdot\text{K}$ , respectively. For  $\text{H}_2\text{O}$ ,  $\Delta H_{\text{fus}} = 6.01 \text{ kJ/mol}$  and  $\Delta H_{\text{vap}} = 40.67 \text{ kJ/mol}$ .

What is the enthalpy change during the process in which 100.0 g of water at  $50.0^{\circ}\text{C}$  is cooled to ice at  $-30.0^{\circ}\text{C}$ ? (Use the specific heats and enthalpies for phase changes given in Sample Exercise 11.4.)

### V. Phase Diagrams (P v. T):

A. Some important points:

1. Lines (AD, AB, AC) represent points where
2. (A): P and T where

3. (B):
- Above this point,
4. : Line AD.
5. : Line AB.
6. : Line AC.
- B. A point about the melting point line. When the slope of this line is is:
  - 1.
  - 2.

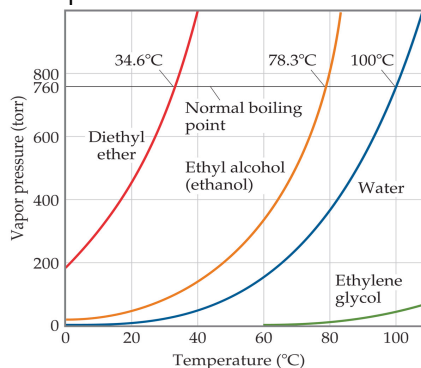

Vapor Pressure

- I. At any temperature,
  - A. The pressure caused by these "escaped" molecules is known as
  - B. As temperature increases,
- II. In a sealed container, the liquid and vapor are in
  - A. The substance

III. Boiling Point:

- A. Normal boiling point: temperature at which

Ex: Estimate the boiling point of diethyl ether under an external pressure of 0.80 atm.

Ex: At what external pressure will ethanol have a boiling point of 60°C?

IV. Calculating vapor pressure

- A. Derived from
- B. The Clausius-Clapeyron Equation:

Solids!

- I. Look at the chart...
- II. Answering AP questions:
  - A. Relate your response to
  - B. Many times, it's all about the electrons ( )!
- III. Alloys
  - A. Mixtures of
  - B. Two types
    - 1. alloy: (One type of atom in the metallic matrix). Ex.:
    - 2. alloy: (One type of atom in the metallic matrix). Ex.:
      - a. special case:
      - b. silicon with other elements to

Polarity and Solubility

- I.
  - A. dissolves and dissolves
  - B. Therefore,
  - C. When answering these questions,

Amorphous SiO<sub>2</sub>
