

2.8 GRAPHING ABSOLUTE VALUES IN THE COORDINATE PLANE

The graph of an absolute value $y = |x|$ is the union of 2 piecewise functions, $y = x$ and $y = -x$. The range of $y = |x|$ must be considered when graphing the rays.

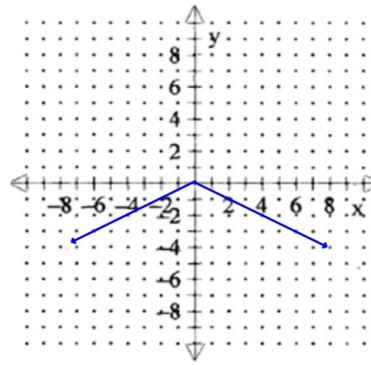

Graphs of other absolute value functions

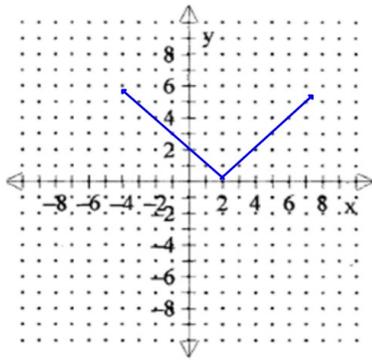

$$y = 2|x|$$

$$y = \frac{-1}{2}|x|$$

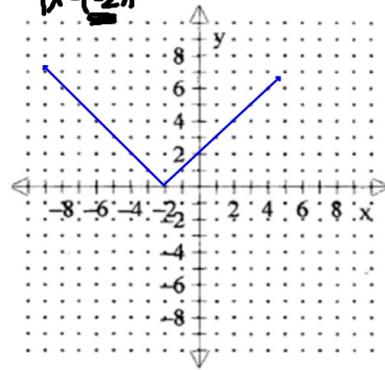

$$y = |x - \underline{2}|$$

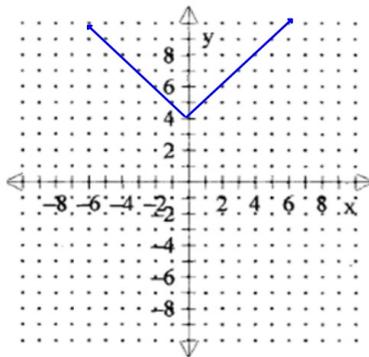

$$y = |x + 2|$$

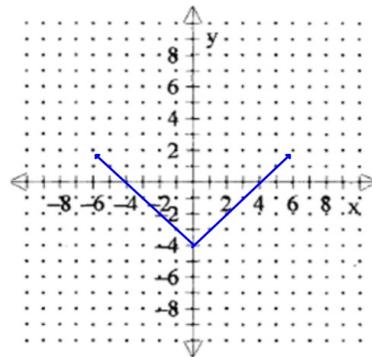

$$|x - \underline{(-2)}|$$

$$y = |x| + 4$$

$$y = |x| - 4$$

General Form: $y = a|x-h| + k$

vertex: (h, k)

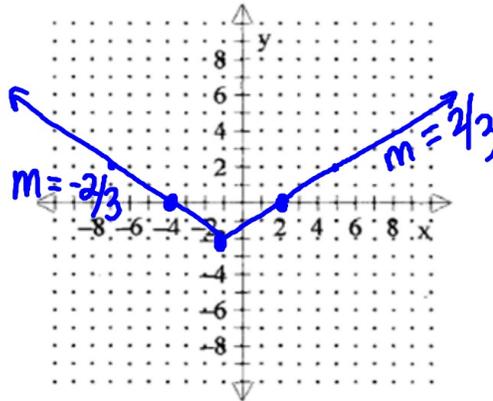

$m = -a$ $m = a$
vertex

a determines direction of opening and $|a|$ determines the width

a is the slope of the ray that rises to the right from the vertex
 $-a$ is the slope of the ray that rises to the left from the vertex

Ex. 1 graph $y = \frac{2}{3}|x-(-1)| - 2$

vertex $(-1, -2)$

Ex. 2 graph $y = -3|x-\underline{2}| + \underline{4}$

vertex $(2, 4)$
