

Graphing Piecewise Functions on TI-83/84

Copyright © 2003–2013 by Stan Brown, [Oak Road Systems](http://www.oakroadsystems.com)

Summary: You can graph piecewise functions on your TI-83/84 by using the TEST menu. To show the method, we'll graph the function

$$f(x) = \begin{cases} x^2 + 11, & x < 0 \\ 11 - 4x, & 0 \leq x \leq 2 \\ x^2 - 3x + 5, & x > 2 \end{cases}$$

which is read "f of x equals x²+11 for x<0, 11-4x for x between 0 and 2 inclusive, and x²-3x+5 for x>2." This particular function, as you'll see, doesn't have any gaps in it, but exactly the same technique works for piecewise functions that do have gaps.

See also: [Graphing Functions on TI-83/84](#)

Set-up: Dot Mode

The TI-83/84 likes to connect dots with continuous lines or curves where it can. But a piecewise function could have gaps legitimately, and therefore you want to select dot mode.

The TI-83 and TI-84 MODE screens are slightly different, but the settings are the same.

[MODE] [▼ 4 times] [▶] [ENTER]

```
Normal Sci Eng
Float 0123456789
Radian Degree
Func Par Pol Seq
Connected Dot
Sequential Simul
Real a+bi re^θi
Full Horiz G-T
```

```
NORMAL SCI ENG
FLOAT 0123456789
RADIAN DEGREE
FUNC PAR POL SEQ
CONNECTED DOT
SEQUENTIAL SIMUL
REAL a+bi re^θi
FULL HORIZ G-T
SETCLOCK08/10/04 7:27AM
```

(You may need to switch between dot mode and connected mode, depending on the functions you're graphing, because a function with a steeply sloping graph will be hard to see in dot mode.)

Enter the Function

Clear any previous plots. (Review this on the [general graphing page](#) if you need to.)

[Y=] and deactivate anything that's highlighted.

Enter the first branch of the function definition, (x²+11).

On the Y= screen, cursor to one of the Y= lines. Press [CLEAR] if necessary, and enter the first piece in parentheses:
[C] [x, T, θ, n] [x²] [+] 11 [D]

Enter the test, (x<0).

Press [C] [x, T, θ, n] [2nd MATH makes TEST] [5] 0 [D]

```
Plot1 Plot2 Plot3
Y1=(X^2+11)(X<0)
Y2=
Y3=
Y4=
Y5=
Y6=
```

Enter the second branch of the function definition, $(11-4x)$.

[+] [(] 11 [-] 4 [x,T,θ,n] D]

Enter the second test, $(0 \leq x \leq 2)$. You can code this either as the product of two tests, $(0 \leq x)(x \leq 2)$, or with an *and* condition, $(0 \leq x \text{ and } x \leq 2)$. The first way saves a couple of keystrokes, so that's what I'll do.

[(] 0 [2nd MATH makes TEST] [6]
[x,T,θ,n] D] [(] [x,T,θ,n]
[2nd MATH makes TEST] [6] 2 D]

```

Plot1 Plot2 Plot3
:Y1=(X^2+11)(X<0)
+(11-4X)(0≤X)(X≤
2)
:Y2=
:Y3=
:Y4=
:Y5=
  
```

Enter a plus sign and the last branch of the function, (x^2-3x+5) .

[+] [(] [x,T,θ,n] [x^2] [-] 3 [x,T,θ,n] [+] 5 D]

Enter the last test, $(x > 2)$.

[(] [x,T,θ,n] [2nd MATH makes TEST]
[3] 2 D]

```

Plot1 Plot2 Plot3
:Y1=(X^2+11)(X<0)
+(11-4X)(0≤X)(X≤
2)+(X^2-3X+5)(X>2)
:Y2=
:Y3=
:Y4=
  
```

Display the Graph

It's often helpful to start with [ZOOM] [6], standard zoom, and then adjust the window. This particular function, I think, is a little easier to visualize with the window parameters shown.

```

WINDOW
Xmin=-2
Xmax=6
Xscl=1
Ymin=-1
Ymax=20
Yscl=1
Xres=1
  
```

You can zoom, trace, and find values and intercepts just as you would do for any other function.

See the [general graphing page](#) for common problems.

One particular problem with piecewise functions is that the TI-83/84 may try to connect the pieces. Make sure you are in dot mode, not connected mode: look on the Y= screen for three dots to the left of your equation.
